Generative AI Guidance – Iowa State University

<https://research.iastate.edu/for-researchers/generative-ai-guidance/>

- “With a technology that is evolving as rapidly as GenAI, any formal policy is **likely to already be outdated by the time it would be enacted across the institution**. Therefore, we urge all principal investigators to **follow the AI guidance and direction of their professional societies, funding agencies, and the publishing houses they target for their research papers.**”
- “[NIH] will not consider applications that are either substantially developed by AI, or contain sections substantially developed by AI, to be original ideas of applicants.”
- NSF: “Research misconduct means fabrication, falsification, or plagiarism, **whether committed by an individual directly or through the use or assistance of other persons, entities, or tools, including artificial intelligence (AI)–based tools**”
- “The default stance on using GenAI for writing research papers **should generally be no – particularly for creative contributions** – due to issues around authorship, copyright, and plagiarism. However, GenAI can be **beneficial for editorial assistance**, provided you are aware of what your target publication deems acceptable.”
- “Most GenAI tools are proprietary ... It is, therefore, impossible for its users to know what data are being used to train the models and how those data are being cleaned and processed. The **black-box nature of these tools** raises important ethical considerations surrounding transparency, bias, and reliability.”
- “Current practices suggest the **appropriate use of GenAI in research** includes enhancing or refining a novel idea, basic analysis/computation, or summarizing data that can be verified.”
- “When defining a research project or gathering necessary background information, **examples of appropriate uses** may include triaging, organizing, and summarizing information; and drafting literature or improving drafts of literature reviews.”
- Public disclosure and patent rights: “OpenAI, the creator of ChatGPT, warns their system “may use Content [a user inputs to the service] to provide, maintain, develop, and improve [their] Services . . .” Further, the GenAI tool may incorporate any data provided into their model, which **could trigger the release of that data to another party**, potentially leading to a third-party disclosure that affects an inventor’s ability to protect his or her invention.”

(Bonus) Reviewer Guidance Email – Royal Society of Chemistry

<https://www.rsc.org/publishing/journals/processes-and-policies/reviewer-responsibilities>

- These were points explicitly listed in the email requesting my review:
- “- reviewers may not submit any manuscript, supplementary information or related materials, to any Large Language Models (LLMs) or Generative Artificial Intelligence (GenAI) chatbots.”
- “- reviewers may not use an AI tool to generate the content of a peer review report”
- “- reviewers may use an AI tool solely for the purposes of copy editing or improving the quality of the language in a peer review report only if the system does not save or use inputs to train the model. Reviewers must disclose this usage to the editor via the ‘Confidential Comments to the Editor’ box on the reviewer report form and state the purpose of the usage and confirm that the AI tool does not save or use the input to train the model”
